HW4 Report

Problem 1. Hough Transform for Line Detection

a. Motivation and Approach

此外 Hough transform 後的圖亮度偏暗,因此使用以下公式使整體較亮。

$$h'(i,j) = 255 * \frac{h(i,j)-min}{max-min}$$
 (若是超過 255 則設定為 255)

d. Discussion of Results

原圖在縱向條紋可以看得出來有鋸齒狀的雜訊,因此在做 edge detection 時也會產生一些不必要的細節,這對 Hough transform 影響頗大,因此最後橫向的直線比縱向的直線更清楚被偵測。以下是在 Gaussian noise 與 salt-and-pepper 兩種雜訊下的結果,Hough transform 似乎仍可以清楚偵測,應該是因為 Canny 在雜訊中仍可清楚偵測邊緣。

Gaussian Noise
